

# Printing and Logging

---

Reference: <https://docs.python.org/3/library/functions.html#print>

In Python, we use the `print()` statement to output information onto the command-line. This is helpful for providing user feedback, as well as for debugging purposes.

```
print("HELLO WORLD") #> HELLO WORLD
```

It is possible to print multiple objects, including different kinds of objects, by separating each with a comma:

```
print("HELLO", "WORLD") #> HELLO WORLD  
print("HELLO", "WORLD", 5, {'a': 1, 'c': 3, 'b': 2}) #> HELLO WORLD 5 {'a':  
1, 'c': 3, 'b': 2}
```
