# Technology Project Management

Software development projects usually involve a team of individuals working collaboratively to implement system requirements and satisfy user needs.

Larger scale projects may involve cross-functional teams of designers, developers, business analysts, and other individuals within or outside of a given organization.

As a part of the technology project management process, project leaders and participants often use Project Management Tools to help them deliver on time and under budget.

And as the scale and scope of the project grows, it becomes more and more important to engage in a formal process of project management, known as the Systems Development Lifecycle.
